4. A method of evaluating onset possibility of rheumatoid arthritis in a human subject, the method comprising the steps of:

detecting whether a gene coding a protein comprising the amino acid sequence of SEQ. ID NO.:1 is present homozygously in the subject; and

evaluating the onset possibility of rheumatoid arthritis in the subject; wherein the homozygous presence of the gene in the subject is indicative of an increased possibility of onset of rheumatoid arthritis in the subject.

Reasons for allowance

2. The following is an examiner's statement of reasons for allowance: The scope of enablement rejection has been withdrawn in view of the declaration and arguments demonstrating that a gene coding for a protein comprising the amino acid sequence of

SEQ ID NO 1 is present homozygously in a subject is indicative of an increased onset possibility of rheumatoid arthritis. The prior art of record does not teach the homozygous presence of a gene coding for a protein comprising SEQ ID NO 1 when homozygous in a human subject indicates an increased risk of rheumatoid arthritis.
